Case 1 — Bordered table (vector borders)

Component	EAL1	EAL2	EAL3
ADV_ARC	1	1	1
ADV_FSP	1	2	3
ADV_TDS	-	1	2

Case 2 — Borderless table (no vectors)

Assurance family	EAL1	EAL2	EAL3	EAL4
ADV_ARC	1	1	1	1
ADV_FSP	1	2	3	4
ADV_TDS	-	1	2	3
ADV_IMP	-	-	-	1
ADV_INT	-	-	-	-
ALC_CMC	1	2	3	4
ALC_CMS	1	2	3	4

Case 3 — Rotated 90 degrees column header

	ADV_FSP.1
ADV_ARC.1	X

Case 4 — Real formula (flattened exponent)

The security level of the algorithm is estimated by the number of operations required for an exhaustive search of the key space.

An attacker must perform approximately 2128 operations to achieve a collision, which exceeds the computational complexity bound acceptable for this security level (bits of entropy: 128).

Case 5 — Known false positive (ToC-style)
